

**Labour mobility within the EU in the context of enlargement and the functioning
of the transitional arrangements**

VC/2007/0293

Deliverable 8

Fondazione Rodolfo Debenedetti (fRDB)

Country Study: Italy

Mattia Makovec

Abstract

This study analyses the implications for the Italian labour market of the recent dramatic upsurge in immigration from the New Member States and the Candidate Countries after the 2004 and 2007 enlargement within the context of the current Italian immigration policy. The study documents the most salient features of the immigrant population before and after the enlargement with respect to demographic characteristics, skill structure, labour market participation, occupational sector, underscoring the main differences and similarities within immigrants subgroups (New Member States vs. Candidate Countries) and between native and foreigners, and discussing their overall implications for the Italian labour market. The main conclusion of the study is that immigrants from NMS-10, NMS-2, and CAND-6 represent a vital resource for the Italian labour market, having contributed substantially to national employment growth especially in the latest years. Further, immigrants from both New Member States and candidate countries appear to act as complement rather than substitutes of native labour given the high national demand for unskilled manual and non-manual workers and for personal and domestic care workers.

1 Overview on the current Italian economic situation

Despite the substantial structural reforms undertaken in the 1990s to meet the parameters of macroeconomic stability required to join the European Monetary Union, during the last decade, the Italian economy has been characterized by very modest growth rates compared to the euro area and by a loss of international competitiveness.

The 2006 and 2007 recovery from the 2001-2005 slowdown looks now as a temporary upswing stimulated by favorable external economic conditions, which have meanwhile vanished with the onset of the ongoing economic and financial crisis. Given the current international economic outlook, the forecasts for the Italian economy in the short-run by national and international institutions have been revised towards pessimistic scenarios.

In the latest years, domestic demand has remained weak given the slow increase in households' real disposable income (Bank of Italy, 2008). Total factor productivity growth has been considerably slow since the end of the 1990s, in particular in the services sector, as opposed to increasing trends observed in the US and in the Scandinavian countries in key sectors such retail trade and financial services (OECD, 2007a). Exports remain one of the most important factors driving growth but their share in the world trade volumes has dramatically declined, by one-third, in the decade 1995-2005 (OECD, 2007a). Exports' positive expansion registered in 2006 and 2007 has been largely driven by sustained foreign demand (in particular by Germany, New EU Member States, China and energy-exporting countries such as Russia) and concentrated in sectors producing capital goods (mechanical machinery and equipment, electrical equipment and precision instruments, metal products and transport equipment) rather than traditional sectors (Bank of Italy, 2008).

Undoubtedly, positive signs came so far from the evolution of the labour market, though the current international economic slowdown might display its effects on national employment and unemployment soon. Between 1996 and 2006, total employment grew by more than 2 million and 600.000 units (of which more than 400.000 units between 2005 and 2006, an increase registered only between 2000 and 2001 in the last decade) leading to a 6.3% growth of the employment rate for the people in working age. At the same time, unemployment fell by more than 900.000 units, corresponding to a decline in the unemployment rate by more than 4%, leading to a historical minimum of 6.8%, a level which had not been observed in Italy since the second half of the 1970s (Table 1). There are three main explanations for such a buoyant performance. First, the constant wage moderation in place since the abolition of the national wage indexation mechanism in 1993 (*scala mobile*). Second, the introduction of a number of labour market reforms (the Treu reform in 1997 and the Biagi reform in 2003) which liberalised employment contracts for new labour market entrants creating new forms of part-time, temporary and fixed-term contracts with lower hiring and firing costs and social

security contributions for the employers. Third, the surge of international immigration started in the mid 1990s: in 2007, more than 65% of the new persons employed (around 230.000 units) were foreigners, and in the same year the share of foreigners in total employment rose to 6.4% from 5.9% registered in 2006 (Bank of Italy, 2008).

As it will be shown in detail in the following sections, immigrant workers currently represent a tremendous resource for the Italian economy, in particular in the Centre-North, where the highest demand for low-skilled jobs (e.g. in the sectors of construction, hotel and restaurants, services for the household) is concentrated.

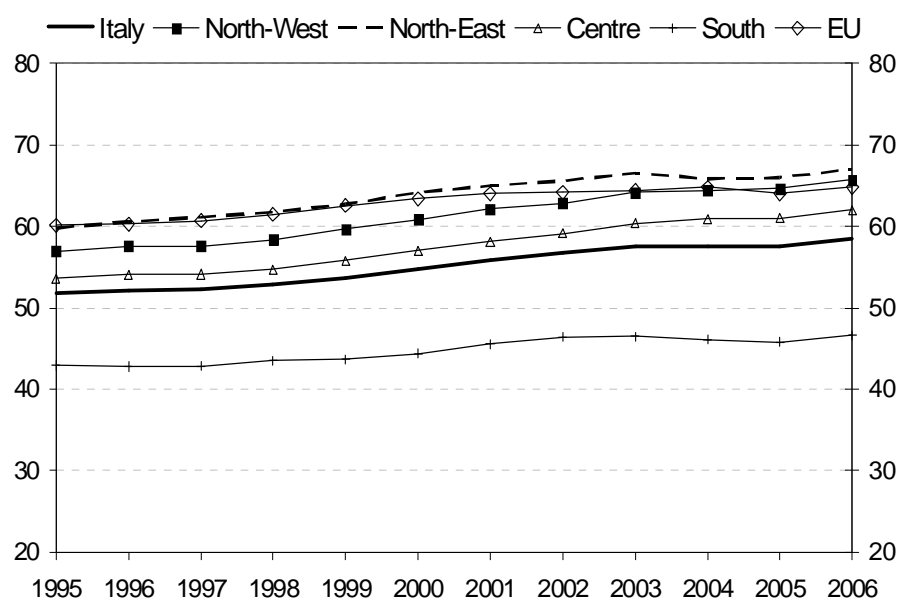

Despite the positive developments outlined above, most of the structural problems affecting the Italian economy seem to persist. The decline in total factor productivity growth can be explained by a lack of capacity to innovate in key service sectors, which could offset the historical productivity slowdown in the manufacturing sector. With this respect, Italy is undergoing an opposite tendency compared to those undertaken by the most advanced industrialized economies currently experiencing productivity growth in skill-intensive sectors, which might further hamper Italy competitiveness in the future. Further, Italy still presents dramatic human capital gaps with respect to the European average: tertiary educational attainment is among the lowest in Europe, representing a barrier both to potential innovation and to international competitiveness. The human capital gap is critical also from the viewpoint of the demand, since the Italian industry specialization has traditionally privileged low-skill intensive production; further, an average small firm scale and the high share of self-employed are probably inadequate to foster R&D and innovation in high-skill intensive sectors. High pension expenditure on the one hand and high debt to GDP ratio on the other put serious constraints to reduction in the tax wedge, one of the highest in Europe and to the introduction of virtuous in-work policies. Further, Italy has been recently introducing some measures to tackle the size of the underground economy, but a lot still needs to be done to reduce substantially its incidence. A related aspect, high crime rates together with poor

infrastructures and inefficiency in public services – other than wage rigidity and strong employment protection - are critical aspects making Italy scarcely attractive to foreign investors, especially in the South, explaining why Italy ranks low in terms of capacity to attract Foreign Direct Investments (OECD, 2007a). Finally, the historical dualism between Northern and Southern regions still represent a persistent phenomenon, with strong differences in labour market performance, productivity and even in student performances as measured by recent PISA standardized test scores (OECD, 2007b).

2 Recent trends and main features of the Italian labour market

Since the mid 1990s, the aggregate performance of the Italian labour market has been constantly improving thanks to a slow but steady increase in the employment rate and a decline in the unemployment rate. The total number of employed persons in 2007 overcame 23 million while the unemployment rate decreased to a historical minimum of 6.1% (EUROSTAT data). The incidence of the long-term unemployed (persons unemployed for more than 12 months) on the total number of unemployed fell from over 65% registered in 1996 to 48.6% in 2006, a level in line with the current EU average. Since 1995, the aggregate employment rate for the population in working age (15-64) has risen from 51.8% to 58.4%: despite the improvement, such level remains below the current EU-27 average (65%) and still far from the Lisbon target of 70% which should be reached by 2010 (Figure 1).

Figure 1: Employment rate in Italy and the EU (Men and Women)

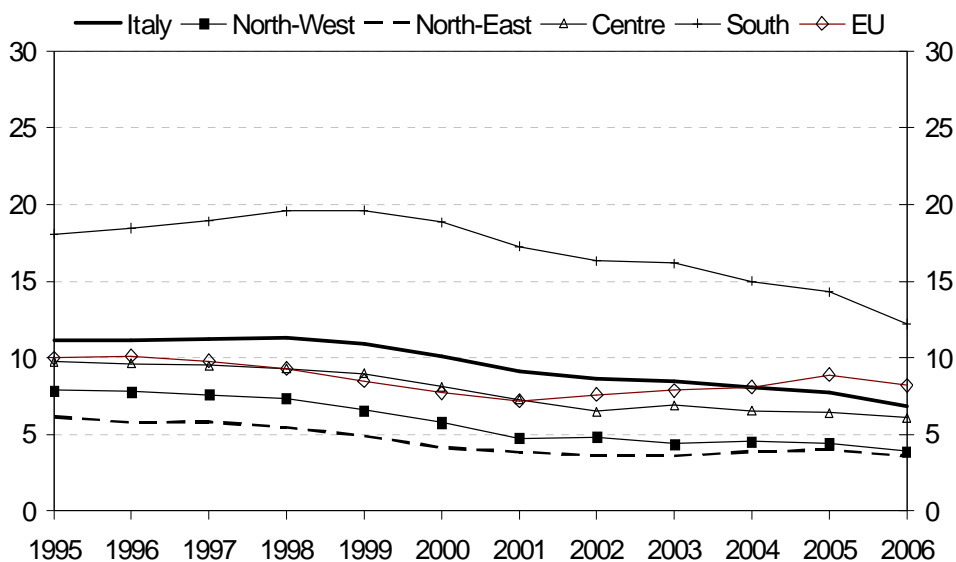

Source: EUROSTAT New Cronos Database and ISTAT Labour Force Surveys (2007)

A similar positive tendency has been observed over the period considered for unemployment: the unemployment rate in 2007 declined to 6.1%, a historical minimum below the EU average (Figure 2). A closer look at the data, though, shows that the traditional gender and regional disparities historically affecting the Italian

labour market still persist, and to some extent, have widened. The regional breakdown of the employment rate trend shows that Northern regions are much closer to the Lisbon target than regions in the South. In particular, in the North-East, in the North-West and in the Centre, the employment rate grew between 7% and 8% in the period considered, while in the South the increase was only of 3.7%.

Figure 2: Unemployment rate in Italy and the EU (Men and Women)

Source: EUROSTAT New Cronos Database and ISTAT Labour Force Surveys (2007)

A further breakdown by gender, shows that both in the North and in the Centre, male employment rates currently reach nearly 80% and, during the last decade, displayed a higher increase than the one registered in the South (now at 70%, Figure 3a). Female employment rate in the South is among the lowest in Europe, largely explaining the overall weak employment performance of the region. In 2006, female employment rate in the South still corresponded to nearly half of female employment rate in the North (31.1% against 56% in 2006, Figure 3b), and to half of the male employment rate in the South (62.3%). The decline of the unemployment rate has been substantial in all regions for both men and women (Figures 4b and 4c). Male unemployment rate in Northern regions in 2006 was one of the lowest observed in Europe (below 3%), and female unemployment rate halved from 10% to 5% over the decade considered. Despite the general declining trend, in 1995 female unemployment rate in the South was 2.5 times as much as higher than in the North while in 2006 the ratio resulted higher than 3 times, signaling that for females the regional unemployment gap has widened, while for men slightly declined. Besides, in Southern regions, the within-region gender gap in unemployment rates remained substantially constant.

The first of the three main explanations of the Italian labour market performance in the last decade is the existence of a long period of wage moderation after the abolition of the national wage indexation scheme (*scala mobile*) in 1993. Table 2

reports the evolution of average real net earnings by gender, macro-regions and type of contract (full time vs. total employees), together with some distributional indicators, showing that the overall real wage growth over the decade considered for full time employees has been extremely modest (below 7%). If on the one hand women's salaries grew twice than men's contributing to the narrowing of the wage gender gap, on the other the regional wage gap has widened, since the profile of real wages in South remained basically flat over ten years. Qualitatively, these results do not change substantially when we consider the total pool of employees, the only difference being that total wage growth has been even more modest.

The growth of part-time employment has been one of the key features of the recent evolutions of the Italian labour market, together with the increase of the share of temporary and flexible contracts. As shown in Table 3, part-time employment accounts now for 8% of total employment, and fixed-term contracts account now for more than 10% of total employment (13% in the South against 8.5% in the Centre-North).

The third most relevant explanation of the recent Italian labour market performance is the upsurge of immigration since the mid 1990s and the contribution of foreign workers to national employment growth. Table 4 compares labour market indicators for natives and foreigners, showing that the highest concentration of foreigners regularly resident in Italy is observed in the prime age group with secondary or lower education for both men and women. Foreign men exhibit by far higher labour market participation and employment rates than natives, in particular for the youngest and oldest age groups, at all education levels. The different labour market performance of foreigners against natives in those age groups reflects most probably the substitution of natives with foreigners in low-skilled jobs and blue-collar occupations, such as workers in the manufacturing and tourist sector or manual workers in the construction and in the agriculture sector. As far as foreign women are concerned, such differences appear as large (52% against 22% for the participation rate and 50% against 21% for the employment rate) only for the oldest age group (55-64), though accounting for only 4% of the regularly resident foreign women. The reasons are most probably on the one hand the structural low Italian female labour market participation, and, on the other, the recent increase in the number of personal and domestic care workers from Central Eastern Europe, in particular from Ukraine, even in this age group. For the youngest age group (15-24), participation and employment rates are slightly higher for foreigners, while for the prime age group (25-54) Italian women outperform foreign residents, reflecting that probably the main motive of female migration remains the joining of family members rather than job search.

3 Institutions and immigration policy

One of the most important factors affecting the time trend of regular visas has been the immigration policy of Italian governments, which has been largely based on ex post regularizations of immigrants already living in the country established from time to time by ad-hoc laws, rather than being selective in the administration of the entry process.

The Italian immigration policy since the mid 1980s has been based on a quota system regulating the regular number of immigrants allowed in the country together with the conditions of entry and residence. The current institution regulating immigration policy in Italy is the so-called "Bossi-Fini" law (no. 189, 30th

of July 2002), which establishes annual quotas through annual decrees. The main difference with respect to previous regulations is that currently the only legal way of entering Italy for job purposes for non-EU citizens is holding a job offer beforehand. Furthermore, the employer should be able to guarantee housing to the immigrant worker and eventually funds in the case the worker might wish to go back to the country of origin. The Law also establishes a net of Immigration Offices ("Sportello Unico per l'Immigrazione") at the province ("provincial") level, with the task of managing the hiring process of immigrants according to the local demand and the issuing of visas for family re-union purposes. The Bossi-Fini law has reduced the duration of stay for job purposes with respect to the previous legislation (the so-called "Turco-Napolitano" law, no. 286/1998): now the visa can be renewed only for a period equal to the previous duration against the double of the previous duration permitted by the 1998 law. Further, the duration of the visa cannot exceed the duration of the job contract, or, in the case of unlimited contracts, a period of two years. The law has also reduced the time limit for applying to the renewal of the visa from 30 days from the expiration date to 60 days in the case of fixed-term contracts, and to 90 days in the case of unlimited contracts. Besides, it has shortened from one year to six months the longest period allowed to dismissed immigrant unemployed workers to find another job. The Bossi-Fini law therefore, while conceived in principle to simplify the management and the implementation of the Italian immigration policy, implies in the end harder requirements both to obtain and to renew a visa for job purposes, and imposes to the immigrant – and to the society as a whole – higher bureaucratic costs (Ministry of Internal Affairs, 2007a). In addition, the condition of holding a regular job offer before entering the country appears realistically very difficult to fulfill, unless in the case of very high-skilled migrants (a minority in the Italian case), which implies that most often, migrants from non-EU countries enter illegally and regularize their position afterwards. The quota established for non-EU workers in non-seasonal jobs corresponded to 170.000 workers in both 2006 and 2007 and to 150.000 in 2008. As it will become clearer in the following sections, though, such figures are too modest to match the national demand of non-EU workers.

Once obtained, the visa is normally renewed annually, and after 5 years of regular visa status, immigrants can apply for a permanent resident status if they can prove they are able to generate an adequate income from economic activity (law no. 40/1998). After ten years of regular residence, immigrants are entitled to apply for Italian citizenship with the possibility to transfer it to their dependent children below 18. The current legislation admits visa application for various reasons other than work (family, study, refugee status, religion etc.); in the case of application for job purposes, the application of the immigrant worker must be supported by the parallel application of the employer.

The first relevant regularization of non-EU immigrants occurred with the so-called "Martelli law" in 1990 (law no. 39/1990), which interested mostly young-aged male immigrants arriving from Northern Africa and Asia. As consequence of the

regularization, the number of foreign residents with a regular visa registered at the beginning of the 1992 rose to 649.000. In spite of the large regularization, the 40% of the visas issued by the Martelli law was not renewed at the expiry date (end of 1992), concerning mainly immigrants who were not regularly employed at the end of the period.

The increase of regular visas observed in the years 1994 and 1995 can be largely ascribed to the increased inflows of foreigners coming from former Yugoslavia Republics as consequence of the ongoing conflicts. The impact of migration from these countries has been slowing down in the second half of the 1990s mainly because of return migration to the countries of origin.

A second major regularization occurred with the "Dini law" of 1995 (law no. 489/1995): the number of visas released as a consequence of the Dini Law has been estimated in 15.000 for 1995, 221.000 for 1996 and 10.000 for 1997, to expire mainly at the end of 1998. Differently from the previous regularization, the majority of the visas released has been renewed at the end of the period. The regularization interested mainly immigrants arriving from Albania who had been entering the country irregularly increasingly since 1991.

In 1998, the larger yearly increase in the number of released visas interested foreigners from Central Eastern European countries (+15.4%) compared to an overall increase of 6.6%, an increase of 5.1% registered from EU countries, 1.8% from Africa, 7.8% from Asia and 4.4% from Central and South America.

At the end of the 1990s, immigrants arriving from former Yugoslavia and other Central Eastern European countries represented a relatively new immigrant population. More than 60% of them in fact were resident in Italy for less than 5 years, 30% between 5 and 9 years summing to more than 90% of this subgroup resident in the country for less than ten years (ISTAT 2000a, 200b). Italy's most traditional immigrant population in fact consisted of immigrants from Northern and Western African countries, nearly 50% of whom was registered as resident in Italy between 5 and 9 years, and around 20% between 10 and 14 years and around 23% and 27% respectively below 5 years. Immigrants from more developed countries (other EU countries, or North American countries) display longer spells of residence, but they are on the other hand the smallest group in terms of incidence on the total population.

The three last most relevant regularizations occurred with the Turco-Napolitano law (1998), but most importantly with the Bossi-Fini law, and the law no. 195, 9th of September 2002. The latter aimed at regularizing domestic care workers and employees with some work experience during the three months before November 2002. The last two regularizations involved 650.000 immigrants and their effects are reflected in the jump in the number of regular visas registered between 2003 and 2004. At the end of 2006, the Italian government, as many other Member States' governments, introduced restrictions to the freedom of movement citizens

from Bulgaria and Romania were supposed to benefit after the 2007 enlargement. A temporary regime was adopted for a year, according to which the freedom of movement principle was applicable only to Bulgarian and Romanian workers of particularly high skill levels, or belonging to "strategic sectors", such as construction, metalworking, domestic and personal care, hotel-related services and the agriculture, maritime and fishing sectors. Bulgarian and Romanian workers employed in other sectors had to apply for a visa. The transitory regime was extended to 2008, and will be in place in 2009 as well.

4 Data: residents and visas

An exact account of the presence of immigrants in Italy is problematic given the non-comparability of the two main existing data source. The first one consists in the register of visas ("permesso di soggiorno") released by the Ministry of Internal Affairs ("Ministro dell'Interno") coming directly from Police records. The second source refers to the number of immigrants counted as regular "residents" of an Italian municipality ("comune") at the end of the year; this number is collected by the National Statistical Institute (ISTAT) once a year through a survey covering all Italian municipalities' register offices. The latter figure, though, does not coincide with the number of immigrants in possess of a regular visa since registration at the municipality register office, once a regular visa is obtained, is not compulsory. Moreover, there are three additional reasons for which the figures coming from the two administrative sources are not directly comparable. First, in the case immigrants possessing a regular visa decide to register towards the end of the year, the registration will not be counted immediately, but will appear in the municipality registers from the following year. Second, registered immigrants who leave the country or those whose visa has expired or has not been renewed during the year, are not immediately cancelled from the municipality registers and might appear as regular residents for another year or more. Third, while municipality registers include immigrant residents of all age groups (including dependent children), data concerning regular visa do not include dependent children below 18 years old who are not obliged to apply for a visa, since their immigrant status in the country depend on the parents' immigrant status. To sum up, figures based on the number of regular visas at the end of the year are likely to underestimate the actual presence of immigrants in the country, while the figures coming from municipality registers might both underestimate and overestimate immigrants' regular presence.

The data provided by the National Statistical Institute on regular residents seem more appropriate to capture the magnitude of the foreign population stably resident in the country. Data from visa registers on the one hand allow capturing year-to-year effects of regularizations implemented by the government but on the other are not very much informative on new inflows, given that regularizations normally involve immigrants already living in the country irregularly. The advantage of data from visa registers is that they include breakdowns by gender, age, years of residence in the country and reason of staying. Furthermore, they are available

without breaks for a time span ranging between the early 1990s and the most recent years (2007), while data on regular residents are only available for a shorter time span. Figure 5 compares the evolution over time of the number of immigrants from the New Member States obtained with both data sources, while a detailed data breakdown by gender and nationality is provided in the Tables A1-A6 in the Appendix. Figure 5 shows the increasing trend of the series from both data sources. The sharp increase in regular residents of the latest years measured from municipality registers data reflects on the one hand the recent regularizations, and on the other, the increase over time in the presence of dependent children. A general limitation of both type of data source is the lack of information on immigrants' skills, education level, occupation, and profession. Such information can be partially recovered or inferred from reports produced regularly by NGO or religious organizations (the "Dossier statistico sull'immigrazione" by Caritas is one of the most important), although not based on statistically representative but rather on selected samples.

Unfortunately, the data obtained from household budget surveys based on representative sample of the population, such as the Survey on Italian Households Income and Wealth carried out by the Bank of Italy, or the EU-SILC (European Survey on Income and Living Conditions) are not very much informative. In fact, either the number of foreign residents included in their samples is too small or their classification does not allow obtaining descriptive statistics broken down by detailed nationality or country of origin.

Figure 5: Regular residents vs. visa holders ("permesso di soggiorno): Men and Women

Note: the original ISTAT reference period is the 1st of January of the year following the year indicated above; hereafter we adopt the 31st of December of the indicated year as reference period for consistency with the rest of the report.

5 General trends before and after the EU enlargement

At the beginning of the 1990s, the number of immigrants resident in Italy in possession of a regular visa was slightly above 600.000; in 2007, this figure reached nearly 2.500.000 units. Looking at the figures corresponding to the number of immigrants registered at municipality register offices (which, as pointed out above, take into account the number of dependent children and are not directly comparable), the increase is even more pronounced, as the regular residents overcame 3.400.000 units at the end of 2007, corresponding to nearly 6% of the total population.

The top panel of Table A1 shows that such growth occurred alongside major changes in the composition of the immigrants' population in the last fifteen years. Firstly, until the early 1990s, immigrants from African countries (in particular from Northern Africa, as Morocco, Tunisia and Egypt, and from Western Africa, as Senegal), represented the most relevant group of foreign residents in Italy, and their incidence was as much as double as those of the other main subgroups (EU Member States, Central Eastern European, Asian, and American countries). Secondly, immigrants from EU member states accounted for 50% of the foreign residents coming from European countries (EU member states, Central Eastern European countries and other non-EU members). Both scenarios changed quite dramatically during the last decade.

Figure 6a: Residents and Visas by nationality (Men and Women)

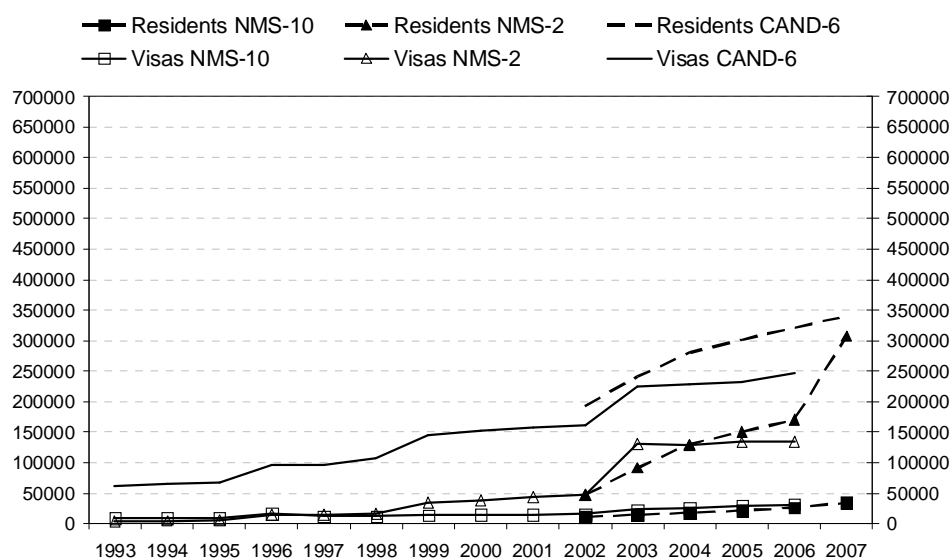

Note: NMS-10: New Member States as of 1st of May 2004; NMS-2: Bulgaria and Romania, CAND-6: Albania, Bosnia and Hercegovina, Croatia, Macedonia, Serbia and Montenegro, Turkey. Data as of 31st of December (See note Figure 5)

Source: <http://demo.istat.it/> and ISTAT (2006b).

In the first half of 1990s, the two most relevant groups of foreign residents within the pool of immigrants coming from European countries were Albanians (around 10%) and citizens from former-Yugoslavia, whose number increased as consequence of mass migration from ongoing conflicts in the Balkans and reached an incidence of 25% in 1994. In the second half of the 1990s, the incidence of Albanian immigrants remained high, rocketing to 18% in 1997; the impact of migration from former Yugoslavia instead became more attenuated because of return migration. In the same year (1997), the presence of immigrants from Romania, already representing the 5% of migrants from European countries, began to rise steeply, and Romanians became the second most important immigrant group from European countries after Albanians. It has to be kept in mind that year-to-year massive increases in the number of regular visas do not generally reflect contemporaneous new inflows but rather recently occurred mass regularization of immigrants already living in the country, as pointed out earlier.

Figure 6b: Residents and Visas by nationality (Men)

Note: NMS-10: New Member States as of 1st of May 2004; NMS-2: Bulgaria and Romania, CAND-6: Albania, Bosnia and Hercegovina, Croatia, Macedonia, Serbia and Montenegro, Turkey. Data as of 31st of December (See note Figure 5)

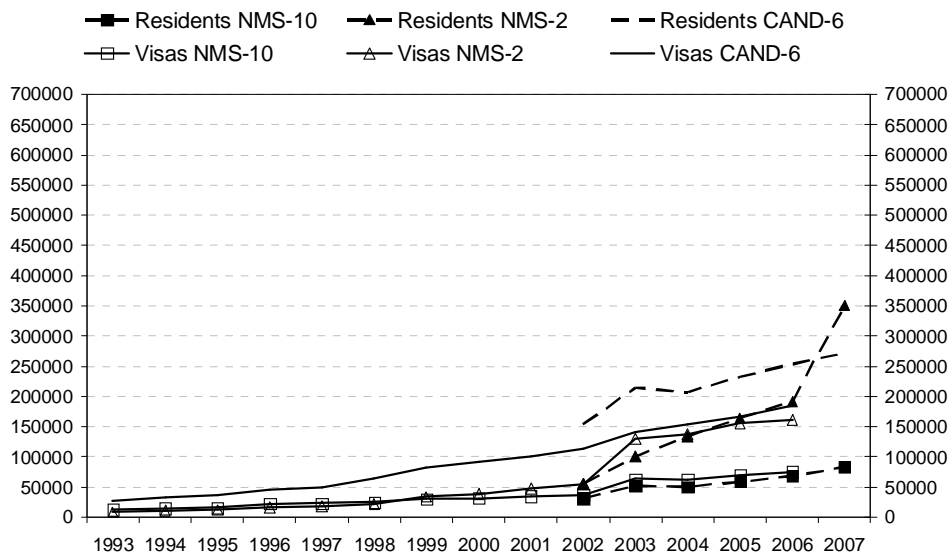

Source: <http://demo.istat.it/> and ISTAT (2006b).

Since the year 2000, the growth of immigrants from Romania and Ukraine has been impressive. In 2006, nationals from Romania became the second largest group of foreign residents following Albanians, but one year later, as consequence of the enlargement, they turned to first in the league table. At the end of 2007, the number of Romanian citizens regularly resident in Italy amounted to over 600.000 individuals, corresponding to around 18% of the total immigrant population in the country, 35% of the foreign population from European countries, and 67% of the foreign population from EU Member States. Albanians became the second largest foreign community counting over 400.000 individuals (11.6% of the total number of

immigrants). An increase of more than 100.000 released visas registered between 2003 and 2004 made Ukrainian nationals the third leading group of migrants from European countries (10% in 2007). Another group emerged recently consists in migrants from Moldova, which in a few years became the sixth leading group (4.3%) following in the league table Serbia and Montenegro (4.7%). The presence of immigrants from the other New Member states is very limited (between 0.5% and 2% of the migrants from European countries), and has not changed substantially after the EU enlargement.

A comparison between Tables A5 and A6 in the Appendix shows that the increase in migration from Central Eastern European countries has been largely driven by female migration, with the exception of Albania and former Yugoslavia Republics. African countries have been the leading group for men migration until 2003, while female migrants from Africa kept the same growth pattern of other subgroups until nowadays. Further, the expansion of female migration from Eastern European countries has been strongly pushed by the increase of female immigrants from Ukraine. Among Ukrainian migrants regularly resident in 2007, gender differences are striking, since the women-to-men ratio reaches 4.1, against 2.4 in the case of Poland, 1,5 in the case of Bulgaria and 1.1 in the case of Romania. This ratio is higher in the former Soviet Republics (Estonia, Latvia, Lithuania and Belarus), though the incidence in these cases is much lower.

Source: <http://demo.istat.it/> and ISTAT (2006b).

Figure 7: Regional distribution of regular residents by group of nationality (2006)

Source: ISTAT Labour Force Surveys (2007)

Finally, Figure 7 and Table A11 in the Appendix illustrate the geographic concentration of immigrants, showing that foreigners from NMS-2 and CAND-6, which are relatively less qualified than NMS-10, are more heavily concentrated (around 60%) in Northern regions where the demand for labour is more elastic.

6 Demographic and labour market trends before and after EU enlargement

Tables A7 to A10 in the Appendix offer a snapshot of the changes occurred in the pool of immigrants from Eastern European Countries with respect to age composition and reason for stay by considering a ten-year time horizon. Immigrants from the New Member States are mostly concentrated in the prime-age (25-44) or working-age groups, while a higher concentration in younger age groups is observed among immigrants from former Yugoslavia or Russia. A comparison between Tables A7 and A8 shows as well the presence of cohort effects, with a shift towards higher incidence of older age groups (between 35 and 39) in 2007 with respect to 1998. Ukraine is the only country exhibiting a much higher incidence of older age groups (50-54 and 55-59) due in particular to the higher presence of women of older age.

Tables A9 and A10 compare immigrants' reasons for stay in 1998 and 2007. Employment is general the main reason for stay, in particular employment as dependent worker. Among the New Member States, we can notice a relative increase in the importance of stay for labour market reason with respect to family reason for women, which might reflect higher integration in the Italian labour market, while the incidence of stay for family reason has remained roughly constant.

Interestingly, for immigrants coming from former Yugoslavia, stay for labour market purposes, was higher in 1997 compared to nowadays, family reasons being now the leading purpose. High incidence of entry for "study reason" reflects alternative strategies of entry in the country in the absence of the conditions for applying immediately for work permit (as in the case of Russian immigrants).

7 The skill structure of immigrants from NMS-10, NMS-2, and CAND-6

According to the National Statistical Institute (ISTAT, 2008a), in 2006, 9.6% of the total resident population in working age in Italy was formed by individuals with tertiary education, 32% with upper secondary education and 58% with lower secondary education or lower (of which 31% lower secondary and 27% primary or no education). Detailed data on immigrants' educational attainment are unfortunately unavailable, since the most recent statistics from the National Statistical Institute on education level of foreigners are not broken down by nationality. We try to compensate for the missing information by combining Census data dating back to 2001 with the figures reported in Deliverable 2 ("Analysis of the scale, direction and structure of labour mobility") based on the 2008 European Labour Force Surveys. Taking into account the differences in the comparability of the two data sources, by this approach, we aim at capturing the main changes in the skill structure of immigrants before and after the 2004 enlargement.

Census data show that, as of 2001, immigrants from NMS-10 and NMS-2 were in general better qualified than natives, mainly for the relatively higher educational level of foreign women (Table 6), while the skill structure of immigrants from CAND-6 was more skewed to lower skill levels, in particular in Bosnia-Herzegovina, Macedonia, Serbia and Montenegro and Turkey. Half of the immigrants from NMS-10 in 2001 had achieved upper secondary education against one fourth of the Italian population and the share of the population with tertiary education was as much as double among NMS-10 nationals in comparison with Italian natives (15% against 7%). Looking at NMS-2, the skill composition of Bulgarian immigrants in 2001 appeared very similar and even more skewed towards tertiary education compared to NMS-10, and the share of tertiary or upper secondary educated was dramatically higher among Bulgarian immigrants than among the Italian native population. The skill distribution of Romanian nationals displayed a similar incidence of upper secondary school degrees compared to NMS-10, while exhibiting a lower share of tertiary-educated. If the incidence of tertiary educated was on the hand lower among immigrants than in the population of origin (11% according to the 2001 Census), on the other, those with upper secondary education were largely over-represented among immigrants compared to nationals in the country of origin (38%).

The differences in the skill structure between the native and the NMS-10 population can be explained firstly by a composition effect. The immigrant population consists prevalently of young and prime-age individuals, whose skill distribution is bound to be very different from that of the *total* Italian population, in which the size of older cohorts with only basic education attainment is considerable. Secondly, Italy has been historically characterized by very low tertiary education attainment rates in comparison to the EU-15 average, and its skill composition is still heavily biased towards primary or lower education groups: this shows why, NMS-10 immigrants

display lower education levels when compared to the average of EU-15 natives, but relatively higher attainments when compared to Italian natives.

Table 6: Educational attainment by nationality (Census 2001)

	Tertiary	Upper Secondary	Lower Secondary or Primary	No education	Total
Italy	7.4	25.8	55.8	11	100

Women	8.5	16.2	55.7	19.6	100.0

Note: composition of the population aged 6 and above by highest educational attainment.

Source: own elaborations based on ISTAT (2006c).

The data reported in Deliverable 2 (Figure 7) show that the skill structure of immigrants from NMS-8 appeared slightly more concentrated towards medium

education levels in 2006 with respect to 2001: the share of immigrants with tertiary education amounts to around 10%, with upper secondary education to 60% and with lower secondary education, primary, or no education to 30%. This can be imputed, first, to mere differences in statistical classifications, since the 2001 Census data refer to the population aged six and above, while figures from Deliverable 2 to individuals in working age. We can speculate though, that differences in the 2006 and 2001 skill distribution result not only from differences in the data sources, but actually reflect a moderate increase in the foreign population with upper secondary education after the enlargement. In fact, even by assuming that all the cohorts which could have achieved upper secondary education in 2006 (those aged 13 to 18 in 2001, corresponding to around 3% of the population according to 2001 Census data), actually reached that education level, the resulting increase would not be enough to justify a 60% share of foreigners with upper secondary degree in the total immigrant population from NMS-8.

The picture emerging from the 2001 Census data relative to CAND-6 is quite different, since for all nationalities the largest group is represented by the population with lower secondary or primary education (ranging from 41% among Croatian nationals to nearly 60% among Turkish nationals). In addition, among immigrants from CAND-6, women do not exhibit substantially higher educational attainment compared to men, and for some nationalities, the incidence of the population subgroup without any education is dramatically high (namely Bosnia-Herzegovina, Macedonia and Serbia and Montenegro). The data presented in Deliverable 2 for 2006, show that the share of immigrants from CAND-6 with tertiary education amounts to around 5%, with upper secondary education to around 35% and with lower secondary education, primary, or no education to around 60%. The skill structure of nationals from CAND-6 appears therefore similar to the one observed before the enlargement, slightly more skewed towards upper secondary levels.

8 The labour market situation of immigrants from NMS-10, NMS-2 and CAND-6 and its implications for the national labour market

Immigrants represent a growing and increasingly important resource for the Italian labour market, characterised by high demand of unskilled labour in low-technology sectors and high demand of personal and domestic services. The incidence of employed immigrants aged 15 and above on total national employment was 3% in 2001 (Census data, ISTAT 2006c), it had grown to 4.6% by the first quarter of 2005 to reach 6.6% in the first quarter of 2008 (Quarterly labour force surveys data, ISTAT 2008b).

As shown in Table 7, immigrants' incidence is higher in the regions of the North and the Centre, which are made more attractive by more favorable job opportunities and by a more dynamic labour demand; the North presents as well higher prevalence of male immigrants. Most importantly, immigrants have been contributing impressively to the last years' employment growth: 58% of the newly

employed persons between the first quarter of 2007 and the first quarter of 2008 were foreigners, 41% in the North, 17% in the Centre and 1% in the South (ISTAT, 2008b).

Table 7. % Incidence of immigrants in the total population: I quarter 2008

	15-64				15+			
	North	Centre	South	Total	North	Centre	South	Total
Population	8.2	7.5	2.1	5.9	6.4	5.8	1.7	4.6
Male	8.4	7.1	2.0	5.9	6.7	5.7	1.6	4.8
Female	8.0	7.8	2.2	5.9	6.0	5.9	1.7	4.5
Labour force	8.7	8.4	2.4	6.8	8.6	8.3	2.4	6.7
Male	9.5	8.1	2.1	6.9	9.3	7.9	2.1	6.7
Female	7.7	8.9	2.9	6.7	7.7	8.8	2.9	6.7
Employment	8.3	8.2	2.5	6.7	8.1	8.1	2.5	6.6
Male	9.2	8.0	2.2	6.8	9.0	7.8	2.2	6.7

Source: own elaborations based on ISTAT Quarterly labour force surveys (2008b).

The figures for visas holders by visa type reported in Table A10 in the Appendix show that immigrants from NMS-10, NMS-2 and CAND-6 account respectively for 4.8%, 14% (of which 13.2% are immigrants from Romania) and 15.5% of the foreigners regularly employed. The incidence of nationals from NMS-10 and NMS-2 is slightly higher among the employed than in the total stock of regular visa holders (4.4% and 12.3% respectively, of which 11.2% corresponding to Romanian nationals), while CAND-6 nationals are relatively under-represented among the employed, as they account for nearly 18% of the stock. Since the number of employed immigrants with regular visa at the end of 2006 (1.422.110) appears in line with the figure provided by the Quarterly labour force statistics for the total number of immigrants employed (1.382.456), we can roughly estimate that immigrants from NMS-10 and NMS-2 at the end of 2006 accounted for around 1% of national employment. According to the estimates by the last Caritas report (Caritas, 2008), at the end of 2007, Romanian nationals amount to one million of residents (11% aged below 18). Caritas' estimates show that the Romanian labour force consists of nearly 700.000 employed (around 586.00 employees, 16.000 self-employed, 13.000 irregular or temporary workers, and around 107.000 involved in informal sector type of jobs) corresponding to 3% of the total employed population in the country, and 56.000 unemployed.

Table 8: Labour market indicators by nationality (Census 2001)

Source: own elaborations based on ISTAT (2006c).

As in the previous section, we compare 2001 Italian Census data with the 2006 European Labour Force Survey data presented in Deliverable 2, with the aim of comparing the labour market performance of immigrants from NMS-10, NMS-2 and CAND-6 countries before and after the enlargement. Table 8 shows that in 2001 immigrants from NMS-10, NMS-2 and CAND-6 exhibited higher employment rates than natives. Men immigrants, in particular, registered employment rates above 70% among all nationalities; females from NMS-10 and NMS-2 displayed higher than natives employment rates while CAND-6 women's performance was poorer, reflecting probably that the main reason for female migration from CAND-6 countries had been family re-union rather than work. Immigrant women also exhibit much higher unemployment rates than men as well as than native women suggesting important gender differences in the job finding probability. Figures from 2006 reported in Deliverable 2 and displayed hereby (Table 9) show a similar overall picture. Though the two group of statistics are not exactly comparable since the ELFS refer to the population aged 15-64, given the low share of immigrants population above 65 (as documented in Tables A7-A8 in the Appendix) we can argue that the increase in the employment rate for all immigrants groups considered has been substantial.

Looking at the composition of employed immigrants by sector, in the first quarter of 2008, nearly 60% of the foreign employed were concentrated in the service sector, against around 25% in the industry sector (of which 14% in the construction sector) and less than 5% in agriculture. The sector of the economy in which the incidence of immigrants on total employment has been rising most steeply is the construction sector, where, at the beginning of 2008, foreign workers amounted to

more than 13% of total employment against 9% registered at the beginning of 2005. The increase in immigrants share in other sectors such as non-construction industry and services has been less sustained, in the order of 2% during the same period, while the incidence of immigrants in the agriculture sector has not changed substantially (ISTAT, 2008b).

Table 9: Composition of working age population by nationality: 2006 (ELFS 2008)

	Employed (%)	Unemployed (%)	Inactive (%)	Total (%)
Italy	58.4	4.0	37.6	100
NMS-8	57.4	3.7	38.9	100
NMS-2	73.3	8.2	18.4	100
CAND-6	62.7	8.4	28.9	100

Note: population aged 15-64.

Source: Deliverable 2, Table 10, based on Eurostat Labour Force Surveys.

Census data by nationality show that in 2001 the employment composition by sector of immigrants from NMS-10 and from Bulgaria was very similar to the one of Italian nationals, being foreign workers mostly concentrated in the service sector (around 65% of the total employed) rather than in industry (30%) and agriculture (5%). The aggregate composition hides important gender differences, since half of male employment was concentrated in the industry sector (an important share of which most likely in the construction sector) while on average more than 70% of female employment was concentrated in the service sector (of which around 50% in personal services, e.g. home and domestic care). With respect to nationals from Romania and CAND-6 instead, men's concentration in the industry sector (nearly 70%) resulted even higher, probably because of their higher participation in the construction sector related to their relatively lower skill profile. Further, in the latest years, the incidence of Romanian nationals in the construction sector is likely to have increased, as a consequences of the measures undertaken to enhance the regularization of irregular employment (the so-called "pacchetto Bersani" for the construction sector, Law 4th of August 2006), which, according to Caritas estimates, should have interested 70.000 Romanian workers.

The overall picture emerging from these data signals that the most required profile among immigrants from New Member States and Candidate countries over the last years remains prevalently that of low-skilled and low-qualified workers. Given the low availability of native workers for occupations, it is unlikely that immigrants crowd natives out in the labour market. This aspect is supported by the evidence documented in past research by Gavosto, Villosio and Venturini (1999) and more recently by Villosio and Venturini (2006), showing that immigrants' presence does not reduce the employment probability of the natives, but rather natives and immigrants labour market participation display complementarities. Further, Villosio and Venturini (1999), show that immigrants' labour market participation affects positively the wage of the natives. In addition, an analysis by CNEL (2004) reports

the existence of an excess demand of immigrant workers in the Italian labour market with respect to the number of regularizations actually realized, according to the firm-level survey Unioncamere in 2002 (700.000 posts available vs. 650.000 regularizations). This aspect might lead to opt for an immigration policy more able to adapt quickly to changes and in labour market demands and needs as opposed to ad-hoc regularizations, which seem to add rather than ease Italian's labour market rigidities.

Table 10: Employment composition by sector and nationality (Census 2001)

	Agriculture	Industry	Services	Other	Total

9 The Public perception of immigrants in Italy and the situation of the Roma

Assessing the public perception of the immigration phenomenon in Italy is a complex task, since the debate of immigration issues is highly politicized and Italian nationals seem quite uninformed on immigration in general. This latter aspect emerges from a survey realized for the Ministry of Internal Affairs (2007b) based on a small sample of 1000 individuals representative of the national population for sex and age. The first noticeable aspect emerging from the survey is that among the interviewed sample there is a considerable misperception about the number of immigrants resident in Italy, in particular about illegal immigrants. Nearly two thirds of the interviewed, in fact, declare to ignore the number of immigrants living in the country, only 5% can guess a figure close to the true value, while 17% underestimate it and the remaining 12% overestimate it. Further, among those providing an estimate, nearly half are convinced that at least 50% of the immigrants are irregular residents, only 8% believe that irregular immigrants are less than 20% of the total, and according to the remaining 40%, the share of irregulars lies between 20% and 50%. In contrast with such view, there is evidence (Ministry of Internal Affairs, 2007a, 2007c) that in 2006 the number of irregular immigrants amounted between 10% and 20% of the total residents. In addition, the survey reveals that there exist mixed and contrasting sentiments of the native population with respect to immigrants: on the one hand of comprehension and solidarity, on the other of fear and distance. For example, from the survey it emerges that there exist a consensus on the usefulness of immigrants with respect to elderly care. The majority of the interviewed agree that immigrants represent an economic resource for the country since they help solving the demand for unskilled labour from the firms. On the other hand, the majority of the interviewed think that immigrants represent a social cost since they perceive they do not pay taxes. There is a polarization of opinions on whether immigrants represent a menace to native workers since they accept lower wages and worse working conditions. Finally, the majority of the interviewed think that immigrants do not represent a menace towards the national social and cultural identity, but at the same time, the majority does not agree that immigrants might bring new values that might enrich the Italian society as a whole.

The general concern existing among a large share of the Italian population, which associates immigrants' presence to less security and higher crime rates, does not seem to be fully well grounded. In fact, if on the one hand, crime rates have increased among immigrants over the last five years, on the other, such increase has been registered mainly among irregular immigrants, while regular migrants exhibit crime rates similar to the natives, in particular Romanian nationals (Ministry of Internal Affairs, 2007c). A concern of the government should be then identifying (and possibly eradicate) those factors which make Italy particularly attractive for immigrants with a high propensity to exert crime. One of the most important is

surely the large underground economy, which provides a natural incentive for illegal activities and imposes high monitoring costs for the government.

Finally, we briefly review the current situation of the Roma minorities. Though no official statistics are available, Roma's population in Italy is estimated between 120.000 and 250.000 units, corresponding to around 3.5% - 7% of the immigrants population, a much smaller figure than the numbers estimated for instance for Spain (around 700.000 units). A precise estimation is also probably complicated by the fact that an important part of the Roma resident in Italy holds Romanian nationality. From the standpoint of the social inclusion policy, the Italian agenda still lacks a systematic approach towards the integration of the Roma. Italy in fact has never applied so far to EU funds for the inclusion of the Roma as other European countries. The first mention of inclusion initiatives appears in the Social Inclusion Report of 2006, but the resources invested seem modest if compared to the effort of other EU countries such as Spain, for instance in the case of the program "Acceder" (European Commission, 2004). For some recent episodes related to police operations in some Roma camps and to the proposal of registering Roma's fingerprints, the Italian Government has been criticized by some international organizations (see European Roma Rights Centre at <http://www.errc.org/>) and NGOs for the risk of violating the no racial discrimination principle enforced by the EU Treaty.

10 Conclusions

This study has shown that immigration from NMS-10, NMS-2, and CAND-6 had an increasing importance for employment growth in Italy over the last decade, contributing dramatically in particular in the years after the enlargement. Further, immigrants from both New Member States and Candidate Countries appear to act as complement rather than substitutes of native labour given the high national demand for unskilled manual and non-manual workers, in particular in the construction sector, and for personal and domestic care workers. Immigrants from NMS-10 and Bulgaria are in general better qualified than natives, mainly for the relatively higher educational level of foreign women while the skill structure of immigrants from Romania and CAND-6 is more skewed towards lower skill levels. Overall, the skill distribution of immigrants from New Member States and Candidate Countries do not seem to have worsened after the enlargement. Further, both NMS and CAND-6 foreigners show higher employment rates than natives, in particular men, while the labour market performance of women from CAND-6 is weaker. Overall, total unemployment has not grown following the sharp increase of foreign workers in the country, but on the contrary has fallen, and employment growth has been stronger in the regions with a larger presence of immigrants. With respect to immigration policy, the current quota system should become more able to take into account the existing demand of foreign labour, in particular to adjust more rapidly with local labour demand. Finally, given the importance of immigrants' labour

market integration, steps forward should be done in terms of inclusion and no-discrimination policy, in particular of excluded minorities as the Roma.
